## Pleated Blind Angled-Bay Measuring Guide

Measure in millimeters how far out from the window any vents or handles protrude. Add 40 mm to this number (to allow space for the head rail of your pleated blinds) and make a note. This is the measurement you will use in the next step.

You will need:

- Metal Tape Measure
- Pencil
- Paper
- Scissors

Cut two pieces of paper into strips that are 300 mm long and as wide as your previous measurement. These two pieces of paper will be used to work out how your blinds will meet each other at the corners.

For example, if you don't have any handles to avoid, your depth would be 40 mm . If you have handles that protrude by 30 mm then your depth would be $70 \mathrm{~mm}(40 \mathrm{~mm}+30 \mathrm{~mm})$.

Place these two papers individually on the windowsills either side of one of your bay windows' corners, making sure the edge of the paper is against the window frame. Slide the two pieces of paper towards each other along the windowsills until the two corners of the papers meet up.

Using a pencil, make a small mark on the windowsill at the point where the paper meets the window frame.

Repeat steps two, three and four for each corner of your bay window.

Measure between each set of marks you have made and write the measurements down. These are the widths of the blinds you will need to order.
